

Mounting instructions for all V2 and V3 Kirk replacement collars

1. Start by removing the original tripod collar by following the directions in your OEM manual.

2. Begin by unscrewing (counter clockwise) the replacement collar locking knob until it stops.

3. Now squeeze slightly on the collar side. This will let the collar locking knob flip down for the collar to hinge open.

4. Please be sure that the black nylon washer and spring are in position as shown in photo.

5. Position the lens into the replacement collar. If your lens has rotation pins, please make sure that they are in line with the groove in the replacement collar.

6. Again squeeze on the collar side and at the same time flip the knob back up to the locking position in the collar. Please note, while flipping the knob back into the locking position, make sure the black nylon washer is as shown in photo **6B** is positioned against the knob. After the knob is properly in position, you are now able to tighten and loosen the collar knob as needed.
